APPENDIX

UNITED STATES CENSUS BUREAU ACS

SECTION 1 INTRODUCTION

The purpose of an Environmental Justice Assessment (EJA) is to identify any specific geographic areas that would necessitate additional efforts for public involvement or participation and to identify underprivileged stakeholders for participation in planning future Stormwater Management Programs (SWMP). Environmental Justice (EJ), as defined by the United States Environmental Protection Agency (USEPA), "is the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies". According to the USEPA, areas for concern are communities with a low income or minority population greater than twice the statewide average.

Using the 2013 to 2017 American Community Survey 5-Year Estimates from the United States Census Bureau and various online tools provided by the USEPA, Lemont Township's (Township) EJA will help the Township comply with the requirements of the Public Involvement and Participation Minimum Control Measure of the General National Pollutant Discharge Elimination System Permit No. ILR40, Part IV. The EJA will also help highlight recommendations for how the Township might create future iterations of its SWMP to better reach all its residents.

SECTION 2 RESULTS

In order to evaluate the demographics and potential harmful environmental exposure areas within the Township, the 2013 to 2017 American Community Survey 5-Year Estimates from the United States Census Bureau and the EJ indices provided by the EJSCREEN tool from the USEPA were used to gather data on potential underprivileged or at-risk stakeholders.

A. <u>American Community Survey 5-Year Estimates</u>

Three categories of demographic data were used to help determine whether any adaptions to the Township's SWMP need to be made (e.g., translating future SWMPs into other languages). These data were obtained from the 2013 to 2017 American Community (ACS) surveys on race, language, and poverty. The ACS is an ongoing survey that provides information on an annual basis about the United States and its people, and the information helps determine how federal and state funds are distributed each year.

1. Race

Racial demographics for the Township were found in the "ACS Demographic and Housing Survey" and a summary of the data is shown in Table 1. Data on race are based on self-identification of survey respondents and the categories are generally reflective of social concepts of race. It was found that the majority of the population in the Township is white, and there is not a large minority population. The full survey is located in Appendix A.

Subject	Estimate	Percent
Total Population	21,872	-
White	19,273	88.1
Black or African American	371	1.7
American Indian and Alaska Native	30	0.1
Asian	559	2.6
Native Hawaiian and Other Pacific Islander	0	0.0
Hispanic or Latino	1,359	6.2
Two or More Races	280	1.3

Table 1 Township's Racial Demographics

2. Language

Language statistics for the Township were found in the "ACS Language Spoken at Home for the Population 5 Years and Over Survey" and a summary of the data is shown in Table 2. Like race, language data are based on self-identified responses, which is important considering when respondents indicate the degree to which they can speak English as a second language ("very well", "well,", "not well," or "not at all"). The majority of the Township population speak English "very well." A further breakdown of languages spoken is presented in Appendix A.

	Total		Speak English less than "very well"		
Subject	Estimate	Percent	Estimate	Percent	
Population 5 years and	21,042	-	1,570	7.5	
over					
Only English	16,672	79.2	-	-	
Spanish	497	2.4	136	0.6	
Indo-European	3,577	17.0	1,329	6.3	
Language					
Asian and Pacific	260	1.2	105	0.5	
Island Language					
Other Language	36	0.2	0	0.0	

Table 2 Languages Spoken in the Township

Poverty

Poverty statistics for the Township were found in the ACS Poverty Status in the Past 12 Months survey and a summary of the data is shown in Table 3. The ACS collects self-reported income data from respondents to complement data from other governmental agencies. It was found that over 90 percent of the Township's population is above the poverty level, where the poverty level is defined by the Office of Management and Budget's poverty threshold methodology. Table 4 provides the full schedule of poverty thresholds by family size for the year 2017. And thus, for

each category, over 90 percent of corresponding Township households surpass the threshold. The full ACS Poverty Survey is located in Appendix A.

		Tota	al	Below Poverty Level

B. EJ Indexes

EJSCREEN, provided by the USEPA, is a preliminary screening tool that helps to identify areas that may need additional consideration for EJ analysis. This program is not meant to label communities as an "EJ Community" nor be used to make decisions regarding EJ concerns; it is meant to be a foundation upon which MS4 communities can launch its EJA and further research and warranted tweaks to its SWMP. The EJSCREEN tool provided by the USEPA calculates an EJ index by combining an environmental factor with local and national demographic indicators. The EJ index is also contingent on the population within the area.

1. Environmental Indicators

There are eleven environmental indicators that EJSCREEN uses that vary in what they indicate. Some quantify the proximity to and the number of potential sources of exposure to environmental pollutants. Others estimate ambient levels of air pollution or estimate air toxics-related cancer risk. The eleven indicators are:

- a. Superfund Proximity
- b. Risk Management Plan (RMP) Site Proximity
- c. Hazardous Waste Proximity
- d. Wastewater Discharge Indicator

- e. National-Scale Air Toxics Assessment (NATA) Cancer Risk
- f. Lead Paint Indicator
- g. Ozone
- h. NATA Respiratory Hazard Index
- i. NATA Diesel Particulate Matter
- j. Particulate Matter (diameter 2.5 micromillimeters or smaller)
- k. Traffic Proximity

High results in any of these areas would indicate that there is a higher potential for exposure to and risk from these indicators.

2. Demographic Indicators

The demographic indicators designate a community's potential susceptibility to be exposed to the environmental indicators and pollution. There are six demographic indicators included in the EJSCREEN tool:

- a. Percent Low-Income
- b. Percent Minority (Race)
- c. Less than high school education
- d. Linguistic isolation
- e. Individuals under age 5
- f. Individuals over age 64

The demographic index is found by averaging the percent minority and percent low-income indicators. The demographic index factor used to calculate the EJ index is the difference between the demographic indices for the local area and for the U.S. According to the *EJSCREEN Technical Documentation*, the other four demographic indicators currently do not have enough quantitative data to be correlated to the potential susceptibility of being exposed to the environmental indicators.

EJ Indices

The 11 EJ indices correspond to the environmental indicators and are calculated by multiplying the environmental indicator by the area population and the demographic index factor. The four EJ indices related to stormwater discharge are the superfund proximity, RMP proximity, hazardous waste proximity, and wastewater discharge indicator, and are shown in Table 5. Region 5 is defined by the USEPA as consisting of the states of Illinois, Indiana, Michigan, Minnesota, Ohio, and Wisconsin. Each EJ index is shown as a percentile comparing its potential of exposure, risk, and proximity of the local group to the state, regional, and national populations. Lower percentile numbers indicate a lower potential of risk.

EJ Index	Percentile				
EJ Index	Illinois	Region 5	USA		
Superfund Proximity	3	7	5		
RMP Proximity	3	2	1		
Hazardous Waste Proximity	11	9	6		
Wastewater Discharge Indicator	3	1	1		

Table 5 EJ Indices for the Township

As seen, the Township is in low percentiles for each EJ Index for Illinois, Region 5, and the nation. These low percentiles indicate that when compared to the state, region, and nation, the Township has a lower risk of being exposed to wastewater pollutants and lower proximities to pollutant facilities.

SECTION 3 RECOMMENDATIONS

Based on the results from the United States Census Survey Estimates and the EJSCREEN tool, it is not necessary for the Township to make any changes to its SWMP to account for underprivileged groups. Because about 92.5 percent of the Township's population speak English "very well," it does not appear that there is any need for any language translations for the SWMP. Additionally, because of having small minority (about 12 percent) and low-income (approximately 6 percent) populations, and from the low EJ Indices, it was determined that there were no specific stakeholders that need to be targeted for participation in planning future SWMPs and best management practices (BMP) placement. Going forward, the Township will continually re-evaluate its EJA and determine whether any nuanced changes should be made to its SWMP and placement of stormwater BMPs.

EDUCATIONAL ATTAINMENT

2013-2017 American Community Survey 5-Year Estimates

Supporting documentation on code lists, subject definitions, data accuracy, and statistical testing can be found on the American Community Survey website in the Technical Documentation section.

Sample size and data quality measures (including coverage rates, allocation rates, and response rates) can be found on the American Community Survey website in the Methodology section.

Although the American Community Survey (ACS) produces population, demographic and housing unit estimates, it is the Census Bureau's Population Estimates Program that produces and disseminates the official estimates of the population for the nation, states, counties, cities, and towns and estimates of housing units for states and counties.

Subject

Data are based on a sample and are subject to sampling variability. The degree of uncertainty for an estimate arising from sampling variability is represented through the use of a margin of error. The value shown here is the 90 percent margin of error. The margin of error can be interpreted roughly as providing a 90 percent probability that the interval defined by the estimate minus the margin of error and the estimate plus the margin of error (the lower and upper confidence bounds) contains the true value. In addition to sampling variability, the ACS estimates are subject to nonsampling error (for a discussion of nonsampling variability, see Accuracy of the Data). The effect of nonsampling error is not represented in these tables.

Lemont township, Cook County,

While the 2013-2017 American Community Survey (ACS) data generally reflect the February 2013 Office of Management and Budget (OMB) definitions of metropolitan and micropolitan statistical areas; in certain instances the names, codes, and boundaries of the principal cities shown in ACS tables may differ from the OMB definitions due to differences in the effective dates of the geographic entities.

Estimates of urban and rural populations, housing units, and characteristics reflect boundaries of urban areas defined based on Census 2010 data. As a result, data for urban and rural areas from the ACS do not necessarily reflect the results of ongoing urbanization.

Source: U.S. Census Bureau, 2013-2017 American Community Survey 5-Year Estimates

Explanation of Symbols:

- 1. An '**' entry in the margin of error column indicates that either no sample observations or too few sample observations were available to compute a standard error and thus the margin of error. A statistical test is not appropriate.
- 2. An '-' entry in the estimate column indicates that either no sample observations or too few sample observations were available to compute an estimate, or a ratio of medians cannot be calculated because one or both of the median estimates falls in the lowest interval or upper interval of an open-ended distribution.
 - 3. An '-' following a median estimate means the median falls in the lowest interval of an open-ended distribution.
 - 4. An '+' following a median estimate means the median falls in the upper interval of an open-ended distribution.
- 5. An '***' entry in the margin of error column indicates that the median falls in the lowest interval or upper interval of an open-ended distribution. A statistical test is not appropriate.
- 6. An '***** entry in the margin of error column indicates that the estimate is controlled. A statistical test for sampling variability is not appropriate.
- 7. An 'N' entry in the estimate and margin of error columns indicates that data for this geographic area cannot be displayed because the number of sample cases is too small.

8. An '(X)' means that the estimate is not applicable or not avail	able.

Data are based on a sample and are subject to sampling variability. The degree of uncertainty for an estimate arising from sampling variability is represented through the use of a margin of error. The value shown here is the 90 percent margin of error. The margin of error can be interpreted roughly as providing a 90 percent probability that the interval defined by the estimate minus the margin of error and the estimate plus the margin of error (the lower and upper confidence bounds) contains the true value. In addition to sampling variability, the ACS estimates are subject to nonsampling error (for a discussion of nonsampling variability, see Accuracy of the Data). The effect of nonsampling error is not represented in these tables.

Employment and unemployment estimates may vary from the official labor force data released by the Bureau of Labor Statistics because of differences in survey design and data collection. For guidance on differences in employment and unemployment estimates from different sources go to Labor Force Guidance.

Workers include members of the Armed Forces and civilians who were at work last week.

Industry codes are 4-digit codes and are based on the North American Industry Classification System 2012. The Industry categories adhere to the guidelines issued in Clarification Memorandum No. 2, "NAICS Alternate Aggregation Structure for Use By U.S. Statistical Agencies," issued by the Office of Management and Budget.

Occupation codes are 4-digit codes and are based on Standard Occupational Classification 2010.

Logical coverage edits applying a rules-based assignment of Medicaid, Medicare and military health coverage were added as of 2009 -- please see https://www.census.gov/library/working-papers/2010/demo/coverage_edits_final.html for more details. The 2008 data table in American FactFinder does not incorporate these edits. Therefore, the estimates that appear in these tables are not comparable to the estimates in the 2009 and later tables. Select geographies of 2008 data comparable to the 2009 and later tables are available at https://www.census.gov/data/tables/time-series/acs/1-year-re-run-health-insurance.html. The health insurance coverage category names were modified in 2010. See https://www.census.gov/topics/health/health-insurance/about/glossary.html#par_textimage_18 for a list of the insurance type definitions.

Beginning in 2017, selected variable categories were updated, including age-categories, income-to-poverty ratio (IPR) categories, and the age universe for certain employment and education variables. See user note entitled "Health Insurance Table Updates" for further details.

While the 2013-2017 American Community Survey (ACS) data generally reflect the February 2013 Office of Management and Budget (OMB) definitions of metropolitan and micropolitan statistical areas; in certain instances the names, codes, and boundaries of the principal cities shown in ACS tables may differ from the OMB definitions due to differences in the effective dates of the geographic entities.

Estimates of urban and rural populations, housing units, and characteristics reflect boundaries of urban areas defined based on Census 2010 data. As a result, data for urban and rural areas from the ACS do not necessarily reflect the results of ongoing urbanization.

Data are based on a sample and are subject to sampling variability. The degree of uncertainty for an estimate arising from sampling variability is represented through the use of a margin of error. The value shown here is the 90 percent margin of error. The margin of error can be interpreted roughly as providing a 90 percent probability that the interval defined by the estimate minus the margin of error and the estimate plus the margin of error (the lower and upper confidence bounds) contains the true value. In addition to sampling variability, the ACS estimates are subject to nonsampling error (for a discussion of nonsampling variability, see Accuracy of the Data).

The effect of nonsampling error is not represented in these tables.

While the 2013-2017 American Community Survey (ACS) data generally reflect the February 2013 Office of Management and Budget (OMB) definitions of metropolitan and micropolitan statistical areas; in certain instances the names, codes, and boundaries of the principal cities shown in ACS tables may differ from the OMB definitions due to differences in the effective dates of the geographic entities.

Estimates of urban and rural populations, housing units, and characteristics reflect boundaries of urban areas defined based on Census 2010 data. As a result, data for urban and rural areas from the ACS do not necessarily reflect the results of ongoing urbanization.

Source: U.S. Census Bureau, 2013-2017 American Community Survey 5-Year Estimates

Explanation of Symbols:

- 1. An '**' entry in the margin of error column indicates that either no sample observations or too few sample observations were available to compute a standard error and thus the margin of error. A statistical test is not appropriate.
- 2. An '-' entry in the estimate column indicates that either no sample observations or too few sample observations were available to compute an estimate, or a ratio of medians cannot be calculated because one or both of the median estimates falls in the lowest interval or upper interval of an open-ended distribution.
 - 3. An '-' following a median estimate means the median falls in the lowest interval of an open-ended distribution.
 - 4. An '+' following a median estimate means the median falls in the upper interval of an open-ended distribution.
- 5. An '***' entry in the margin of error column indicates that the median falls in the lowest interval or upper interval of an open-ended distribution. A statistical test is not appropriate.
 - 6. An '*****' entry in the margin of error column indicates that the estimate is controlled. A statistical test for sampling variability is not appropriate.
- 7. An 'N' entry in the estimate and margin of error columns indicates that data for this geographic area cannot be displayed because the number of sample cases is too small.
 - 8. An '(X)' means that the estimate is not applicable or not available.

Data are based on a sample and are subject to sampling variability. The degree of uncertainty for an estimate arising from sampling variability is represented through the use of a margin of error. The value shown here is the 90 percent margin of error. The margin of error can be interpreted roughly as providing a 90 percent probability that the interval defined by the estimate minus the margin of error and the estimate plus the margin of error (the lower and upper confidence bounds) contains the true value. In addition to sampling variability, the ACS estimates are subject to nonsampling error (for a discussion of nonsampling variability, see Accuracy of the Data). The effect of nonsampling error is not represented in these tables.

While the 2013-2017 American Community Survey (ACS) data generally reflect the February 2013 Office of Management and Budget (OMB) definitions of metropolitan and micropolitan statistical areas; in certain instances the names, codes, and boundaries of the principal cities shown in ACS tables may differ from the OMB definitions due to differences in the effective dates of the geographic entities.

Estimates of urban and rural populations, housing units, and characteristics reflect boundaries of urban areas defined based on Census 2010 data. As a result, data for urban and rural areas from the ACS do not necessarily reflect the results of ongoing urbanization.

Source: U.S. Census Bureau, 2013-2017 American Community Survey 5-Year Estimates

Explanation of Symbols:

- 1. An '**' entry in the margin of error column indicates that either no sample observations or too few sample observations were available to compute a standard error and thus the margin of error. A statistical test is not appropriate.
- 2. An '-' entry in the estimate column indicates that either no sample observations or too few sample observations were available to compute an estimate, or a ratio of medians cannot be calculated because one or both of the median estimates falls in the lowest interval or upper interval of an open-ended distribution.
 - 3. An '-' following a median estimate means the median falls in the lowest interval of an open-ended distribution.
 - 4. An '+' following a median estimate means the median falls in the upper interval of an open-ended distribution.
- 5. An '***' entry in the margin of error column indicates that the median falls in the lowest interval or upper interval of an open-ended distribution. A statistical test is not appropriate.
 - 6. An '***** entry in the margin of error column indicates that the estimate is controlled. A statistical test for sampling variability is not appropriate.
- 7. An 'N' entry in the estimate and margin of error columns indicates that data for this geographic area cannot be displayed because the number of sample cases is too small.

8. An '(X)' means that the estimate is not applicable or not available.

ACS DEMOGRAPHIC AND HOUSING ESTIMATES

2013-2017 American Community Survey 5-Year Estimates

Supporting documentation on code lists, subject definitions, data accuracy, and statistical testing can be found on the American Community Survey website in the Technical Documentation section.

Sample size and data quality measures (including coverage rates, allocation rates, and response rates) can be found on the American Community Survey website in the Methodology section.

Although the American Community Survey (ACS) produces population, demographic and housing unit estimates, it is the Census Bureau's Population Estimates Program that produces and disseminates the official estimates of the population for the nation, states, counties, cities, and towns and estimates of housing units for states and counties.

Data are based on a sample and are subject to sampling variability. The degree of uncertainty for an estimate arising from sampling variability is represented through the use of a margin of error. The value shown here is the 90 percent margin of error. The margin of error can be interpreted roughly as providing a 90 percent probability that the interval defined by the estimate minus the margin of error and the estimate plus the margin of error (the lower and upper confidence bounds) contains the true value. In addition to sampling variability, the ACS estimates are subject to nonsampling error (for a discussion of nonsampling variability, see Accuracy of the Data). The effect of nonsampling error is not represented in these tables.

For more information on understanding race and Hispanic origin data, please see the Census 2010 Brief entitled, Overview of Race and Hispanic Origin: 2010, issued March 2011. (pdf format)

While the 2013-2017 American Community Survey (ACS) data generally reflect the February 2013 Office of Management and Budget (OMB) definitions of metropolitan and micropolitan statistical areas; in certain instances the names, codes, and boundaries of the principal cities shown in ACS tables may differ from the OMB definitions due to differences in the effective dates of the geographic entities.

Estimates of urban and rural populations, housing units, and characteristics reflect boundaries of urban areas defined based on Census 2010 data. As a result, data for urban and rural areas from the ACS do not necessarily reflect the results of ongoing urbanization.

Explanation of Symbols:

- 1. An '**' entry in the margin of error column indicates that either no sample observations or too few sample observations were available to compute a standard error and thus the margin of error. A statistical test is not appropriate.
- 2. An '-' entry in the estimate column indicates that either no sample observations or too few sample observations were available to compute an estimate, or a ratio of medians cannot be calculated because one or both of the median estimates falls in the lowest interval or upper interval of an open-ended distribution.
 - 3. An '-' following a median estimate means the median falls in the lowest interval of an open-ended distribution.
 - 4. An '+' following a median estimate means the median falls in the upper interval of an open-ended distribution.
- 5. An '***' entry in the margin of error column indicates that the median falls in the lowest interval or upper interval of an open-ended distribution. A statistical test is not appropriate.
 - 6. An '*****' entry in the margin of error column indicates that the estimate is controlled. A statistical test for sampling variability is not appropriate.
- 7. An 'N' entry in the estimate and margin of error columns indicates that data for this geographic area cannot be displayed because the number of sample cases is too small.
 - 8. An '(X)' means that the estimate is not applicable or not available.
